

Updates in January 2009

The second week of January 2009 a new update was released for the Speed power calculation tool.

The following things have changed:

- Instead of minimised and advance the two different calculation modes have been called Simple mode and Regular mode(the most complete and the preferable one!).
- It is now possible to insert the value of the Half entrance angle on the waterline
- It is now possible to insert the Relative rotative efficiency value
- The order of appearance of the input has been also slightly changed
